

7:00 am

Aug 4:30pm

5:00pm

5:10pm

5:15 - 5:30pm

early morning blast for a long day

school

looking through social media #gettingjealous

meanwhile at work, surrounded by an unhealthy lifestyle

I want to be a part of the fitness community too

so exhausted!

HW Time!

sleeping time!
tomorrow will be a good day!
Fitness has boosted my mood!

Google FireBase → login

- Certain body parts

- do you have any gym mat? weights?

- push notifications

- cordova (camera will)

What I learned from story-boarding:

After expressing my ideas out on paper and sharing them to peers, my classmates were able to more clearly understand how I saw my app in action, but more importantly, they were able to get ideas to help make my app more user-friendly. The building off ideas part of talking to my classmates was really helpful. They wanted to see more of what functions the app has, and that I should consider the users environment when they open up my app. Are they free to do my workout at a gym, at home with a yoga mat, at the park on an open field, etc? Maybe the user would like having sassy push notifications in the morning to remind them of their workout and set an alarm for the time they committed for doing the workout? I should also give them the option to choose the target body part they want to work out!
